FORM 8-K

CURRENT REPORT  
Pursuant to Section 13 OR 15(d) of The Securities Exchange Act of 1934  
Date of Report (Date of earliest event reported): September 29, 2022

AXCELLA HEALTH INC.  
(Exact name of registrant as specified in its charter)

Delaware  
(State or other jurisdiction  
of incorporation)

001-38901  
(Commission  
File Number)

26-3321056  
(IRS Employer  
Identification No.)

840 Memorial Drive  
Cambridge, Massachusetts  
(Address of principal executive offices)

02139  
(Zip Code)

Registrant's telephone number, including area code: (857) 320-2200

Not Applicable  
(Former name or former address, if changed since last report)

Check the appropriate box below if the Form 8-K filing is intended to simultaneously satisfy the filing obligation of the registrant under any of the following provisions ( see General Instruction A.2. below):

- ☐ Written communications pursuant to Rule 425 under the Securities Act (17 CFR 230.425)
- ☐ Soliciting material pursuant to Rule 14a-12 under the Exchange Act (17 CFR 240.14a-12)
- ☐ Pre-commencement communications pursuant to Rule 14d-2(b) under the Exchange Act (17 CFR 240.14d-2(b))
- ☐ Pre-commencement communications pursuant to Rule 13e-4(c) under the Exchange Act (17 CFR 240.13e-4(c))

Securities registered pursuant to Section 12(b) of the Act:

Title of each class	Trading Symbol(s)	Name of each exchange on which registered
Common Stock, \$0.001 Par Value	AXLA	Nasdaq Global Market

Indicate by check mark whether the registrant is an emerging growth company as defined in Rule 405 of the Securities Act of 1933 (§230.405 of this chapter) or Rule 12b-2 of the Securities Exchange Act of 1934 (§240.12b-2 of this chapter).

Emerging growth company ☒

If an emerging growth company, indicate by check mark if the registrant has elected not to use the extended transition period for complying with any new or revised financial accounting standards provided pursuant to Section 13(a) of the Exchange Act. ☐

**Item 7.01 Regulation FD Disclosure.**

On September 29, 2022, Axcella Health Inc. (the “Company” or “Axcella”) issued a press release announcing interim data from its Phase 2b clinical trial of AXA1125 for the treatment of Nonalcoholic Steatohepatitis (NASH) entitled “Axcella Announces Positive Interim Data from Phase 2b EMMPACT Study of AXA1125 in Nonalcoholic Steatohepatitis (NASH).” The Company also hosted a conference call to discuss the interim data on Thursday, September 29, 2022 at 8:00 a.m. Eastern Time. Copies of the press release and presentation are attached as Exhibits 99.1 and 99.2, respectively, to this Current Report on Form 8-K and are incorporated herein by reference.

*The information in this Item 7.01 and Exhibits 99.1 and 99.2 attached hereto shall not be deemed “filed” for purposes of Section 18 of the Securities and Exchange Act of 1934, as amended, or otherwise subject to the liabilities of that section, nor shall they be deemed incorporated by reference in any filing under the Securities Act of 1933, as amended, or the Exchange Act, except as expressly set forth by specific reference in such filing.*

**Item 8.01 Other Events.**

On September 29, 2022, the Company reported interim results from the ongoing global Phase 2b randomized, double-blind, placebo-controlled, dose ranging EMMPACT study to evaluate the safety, tolerability, and efficacy of AXA1125 for the treatment of NASH. These interim results report findings regarding the effects of AXA1125 administration on selected outcome measures after 12 and 24 weeks of treatment.

This interim analysis was preplanned to be conducted when enrollment reached 30% of the target of 270 subjects with biopsy confirmed stage 2 or 3 NASH across all trial arms. Data from this ongoing blinded study included 82 subjects at week 12 and 58 subjects at week 24; approximately half of the subjects have type 2 diabetes mellitus (T2DM). In addition to effects on hepatic fat and alanine aminotransferase (ALT), previously reported in 2 other studies, this study also included vibration controlled transient elastography (FibroScan), a widely accepted and accessible non-invasive test (NIT) that assesses both liver fat and stiffness. Specifically, the study examines liver stiffness, changes of which have been correlated with improvements in liver fibrosis and outcomes in clinical studies. Study participants were randomized 1:1:1 to receive either a placebo or 22.6g or 33.9g of AXA1125 twice daily.

At 24-weeks there were statistically significant improvements in the liver stiffness measurement (LSM) compared to placebo in the high dose arm for all subjects. Absolute changes in LSM were 0.13, -2.01, and -4.07 kilopascals (kPa) in the placebo, low dose and high dose arms, respectively (p= 0.0992 and 0.0096 for the low and high dose, respectively, compared to placebo). These results were supported by statistically significant improvements in other NITs of liver fibrosis: ELF and FIB-4. Statistically significant improvements in ALT were seen at both weeks 12 and 24 in all subjects (placebo-adjusted difference of -28.61% (p=0.0183) and -36.3% (p=0.0017) for the low and high doses, respectively). All subjects experienced significantly greater changes from baseline in MRI-PDFF at 12-weeks compared to the change from baseline in the placebo group (placebo adjusted difference of -18.98% (p=0.0082) and -21.24% (p=0.0014) for the low and high doses, respectively). Numerical trends of improvement relative to placebo in PDFF were seen at week 24 but these were not statistically significant in the small number of subjects. Overall, these positive results confirm AXA1125’s multi-targeted impact, a differentiated approach to directly and simultaneously targeting multiple pathways that are dysregulated in NASH. Consistent with previous results, AXA1125 was found to be very safe and well-tolerated in this study. Both dose levels are active and will be continued. Consistent with prior clinical trials, T2DM showed results comparable to non-diabetics.

---

Cautionary Note Regarding Forward-Looking Statements

This Form 8-K contains forward-looking statements within the meaning of the Private Securities Litigation Reform Act of 1995, as amended, including, without limitation, the potential for AXA1125 to serve as a first-line treatment option. The words “may,” “will,” “could,” “would,” “should,” “expect,” “plan,” “anticipate,” “intend,” “believe,” “estimate,” “predict,” “project,” “potential,” “continue,” “target” and similar expressions are intended to identify forward-looking statements, although not all forward-looking statements contain these identifying words. Any forward-looking statements in this Form 8-K are based on management’s current expectations and beliefs and are subject to a number of risks, uncertainties and important factors that may cause actual events or results to differ materially from those expressed or implied by any forward-looking statements contained in this Form 8-K, including, without limitation, those related to the potential impact of COVID-19 on the Company’s ability to conduct and complete its ongoing or planned clinical studies and clinical trials in a timely manner or at all due to patient or principal investigator recruitment or availability challenges, clinical trial site shutdowns or other interruptions and potential limitations on the quality, completeness and interpretability of data the Company is able to collect in its clinical trials of AXA1125, other potential impacts on the Company’s business and financial results, including with respect to its ability to raise additional capital and operational disruptions or delays, changes in law, regulations, or interpretations and enforcement of regulatory guidance, whether data readouts support the Company’s clinical trial plans and timing, clinical trial design and target indications for AXA1125, the clinical development and safety profile of AXA1125 and its therapeutic potential, whether and when, if at all, the Company’s product candidates will receive approval from the FDA or other comparable regulatory authorities, potential competition from other biopharma companies in the Company’s target indications, and other risks identified in the company’s SEC filings, including Axcella’s Annual Report on Form 10-K, Quarterly Reports on Form 10-Q and subsequent filings with the SEC. The Company cautions you not to place undue reliance on any forward-looking statements, which speak only as of the date they are made. Axcella disclaims any obligation to publicly update or revise any such statements to reflect any change in expectations or in events, conditions or circumstances on which any such statements may be based, or that may affect the likelihood that actual results will differ from those set forth in the forward-looking statements. Any forward-looking statements contained in this Form 8-K represent the company’s views only as of the date hereof and should not be relied upon as representing its views as of any subsequent date. The Company explicitly disclaims any obligation to update any forward-looking statements.

**Axcella Announces Positive Interim Data from Phase 2b EMMPACKT Study of AXA1125 in Nonalcoholic Steatohepatitis (NASH)**

*Subjects enrolled with biopsy confirmed NASH experienced clinically and statistically significant improvements in liver stiffness as measured by FibroScan, a non-invasive measure of liver fibrosis*

*Subjects with NASH experienced clinically and statistically significant improvements in alanine aminotransferase (ALT), a measure of liver cell inflammation, at both dose levels of AXA1125*

*Findings demonstrate improvement in hepatic fat as measured by MRI-PDFF*

*AXA1125 continues to demonstrate a safe and well tolerated profile*

*Axcella to host a conference call today at 8:00 a.m. ET; To register, click [here](#)*

**CAMBRIDGE, Mass. – Sept. 29, 2022** – Axcella Therapeutics (Nasdaq: AXLA), a clinical-stage biotechnology company pioneering a new approach to treat complex diseases using multi-targeted endogenous metabolic modulator (EMM) compositions, today reported interim results from their ongoing global Phase 2b randomized, double-blind, placebo-controlled, dose ranging EMMPACKT study to evaluate the safety, tolerability, and efficacy of AXA1125 for the treatment of NASH. These interim results report findings regarding the effects of AXA1125 administration on selected outcome measures after 12- and 24-weeks of treatment.

This interim analysis was preplanned to be conducted when enrollment reached 30% of the target of 270 subjects with biopsy confirmed stage 2 or 3 NASH across all trial arms. Data from this ongoing blinded study included 82 subjects at week 12 and 58 subjects at week 24; approximately half of the subjects have type 2 diabetes mellitus (T2DM). In addition to effects on hepatic fat and ALT, previously reported in 2 other studies, this study also included vibration controlled transient elastography (FibroScan), a widely accepted and accessible non-invasive test (NIT) that assesses both liver fat and stiffness. Specifically, the study examines liver stiffness, changes of which have been correlated with improvements in liver fibrosis and outcomes in clinical studies. Study participants were randomized 1:1:1 to receive either a placebo or 22.6g or 33.9g of AXA1125 twice daily.

At 24-weeks there were statistically significant improvements in the liver stiffness measurement (LSM) compared to placebo in the high dose arm for all subjects. Absolute changes in LSM were 0.13, -2.01, and -4.07 kilopascals (kPa) in the placebo, low dose and high dose arms, respectively ( $p=0.0992$  and  $0.0096$  for the low and high dose, respectively, compared to placebo). These results were supported by statistically significant improvements in other NITs of liver fibrosis: ELF and FIB-4. Statistically significant improvements in ALT were seen at both weeks 12 and 24 in all subjects (placebo-adjusted difference of -28.61% ( $p=0.0183$ ) and -36.3% ( $p=0.0017$ ) for the low and high doses, respectively). All subjects experienced significantly greater changes from baseline in MRI-PDFF at 12-weeks compared to the change from baseline in the placebo group (placebo adjusted difference of -18.98% ( $p=0.0082$ ) and -21.24% ( $p=0.0014$ ) for the low and high doses, respectively). Numerical trends of improvement relative to placebo in PDFF were seen at week 24 but these were not statistically significant in the small number of subjects. Overall, these positive results confirm AXA1125's multi-targeted impact, a differentiated approach to directly and simultaneously targeting multiple pathways that are dysregulated in NASH. Consistent with previous results, AXA1125 was found to be very safe and well-tolerated in this study. Both dose levels are active and will be continued. Consistent with prior clinical trials, T2DM showed results comparable to non-diabetics.

“We find the results from this 12- and 24-week interim analysis to be extremely encouraging,” commented Axcella CEO Bill Hinshaw. “They indicate that administration of AXA1125 over 24-weeks leads to statistically significant improvements compared to placebo in biomarkers for metabolism, inflammation and fibrosis, underscoring its multi-targeted efficacy. Given AXA1125’s market leading safety and tolerability profile, and its oral dosing, these findings position AXA1125 as an attractive candidate for first line treatment of NASH. We look forward to the continuation of the trial and gathering the data from the complete patient population. We expect to report the topline, 48-week biopsy results in the first half of 2024.”

Dr. Margret Koziel, Chief Medical Officer of Axcella remarked that “The positive change in liver stiffness at 24-weeks at both dose levels suggests that AXA1125 administration is correlated with improvement in fibrosis, which is the major histologic finding associated with liver disease mortality. This, in concert with effects on hepatic fat and inflammation, provides significant confidence in our ability to demonstrate improvements in liver histology at the end of this study.” NASH expert, Dr. Stephen Harrison, added: “I find these results to be very promising. NASH is a complex condition that must be addressed by modulating multiple pathways. Axcella’s multi-targeted approach is well-suited to playing an important role in addressing the challenges posed by the condition, and these preliminary results offer further support for this therapeutic strategy. Moreover, AXA1125 has a very favorable risk-benefit profile given its impact on disease activity and its high level of safety, creating an opportunity for a frontline treatment option in NASH.”

**About Axcella Therapeutics (Nasdaq: AXLA)**

Axcella is a clinical-stage biotechnology company pioneering a new approach to treat complex diseases using compositions of endogenous metabolic modulators (EMMs). The company’s product candidates are comprised of EMMs and derivatives that are engineered in distinct combinations and ratios to restore cellular homeostasis in multiple key biological pathways and improve cellular energetic efficiency. Axcella’s pipeline includes lead therapeutic candidates in Phase 2 development for the treatment of Long COVID and non-alcoholic steatohepatitis (NASH). The company’s unique model allows for the evaluation of its EMM compositions through non-IND clinical studies or IND clinical trials. For more information, please visit [www.axcellatx.com](http://www.axcellatx.com).

# Multi-Targeted Therapeutics to Restore Homeostasis

Leveraging Endogenous Metabolic Modulator (EMM) compositions to treat complex medical

- Complex conditions are driven by dysregulation in multiple biological pathways, limiting the effect of single-targeted therapies
- Amino acid-based therapeutics can be safely used to:
  - Regulate key signaling pathways
  - Restore mitochondrial function
  - Shift substrate/redox balance to restore homeostasis
- Potential therapeutic benefits include:
  - Enhancing muscle function
  - Improving neurocognition
  - Correcting metabolism
  - Rebalancing IEMs
  - Decreasing inflammation
  - Reducing fibrosis

*Axcella's clinical data demonstrate the potential to harness the power of EMMs to tackle complex chronic conditions*

IEM = Inborn Errors of Metabolism

# Summary of Results From this Interim Analysis

- Significant effects on liver stiffness comparable to or better than other agents
- Continued demonstration of effects on relevant pathways of NASH biology
- Observed safety and tolerability pattern consistent with high safety margin
- Both doses are active, and effects consistent in overall population and T2DM
- Results position AXA1125 to be potential first line treatment in NASH

## AXA1125 Regulates Mitochondrial Metabolism

### Beta Oxidation Genes Upregulated by AXA1125

#### Beta Oxidation Pathway Upregulated by AXA1125

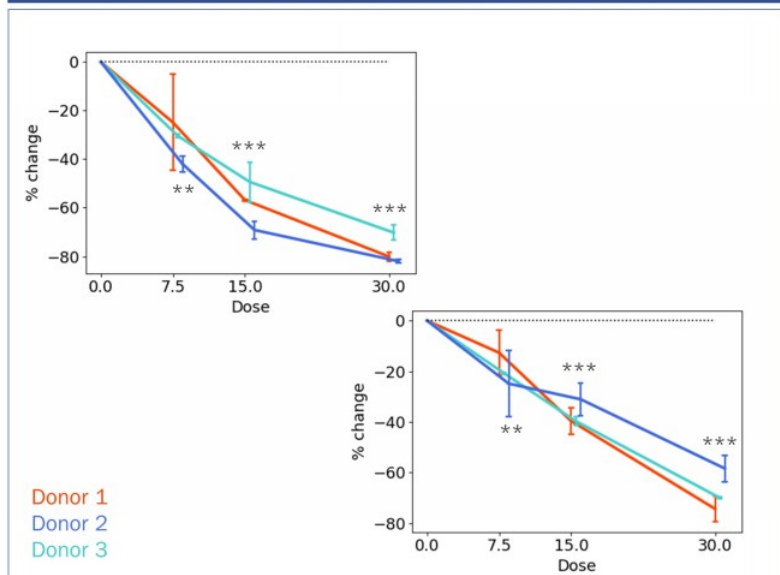

Data derived Primary Human Hepatocyte (PHH) Lipotoxicity Model  
Primary Human Hepatocytes were co-treated for 48 hours with 167uM:333uM palmitate:oleate and 1 ng/ml TNF- $\alpha$  to simulate conditions in NASH, 30x LIVRQNaC, RNA was collected in triplicate for RNA-Seq

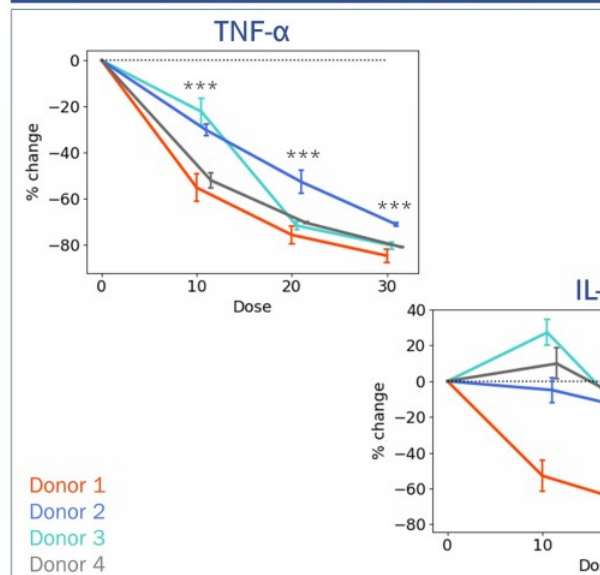

# AXA1125 Decreases Hepatocyte Damage and Immune Cell Recruitment and Decreases Proinflammatory Cytokines

Multi-targeted impact on inflammation: Decreased Damage, Recruitment, Cytokines

## AXA1125 Decreases Hepatocyte Damage and Promotes Immune Recruitment

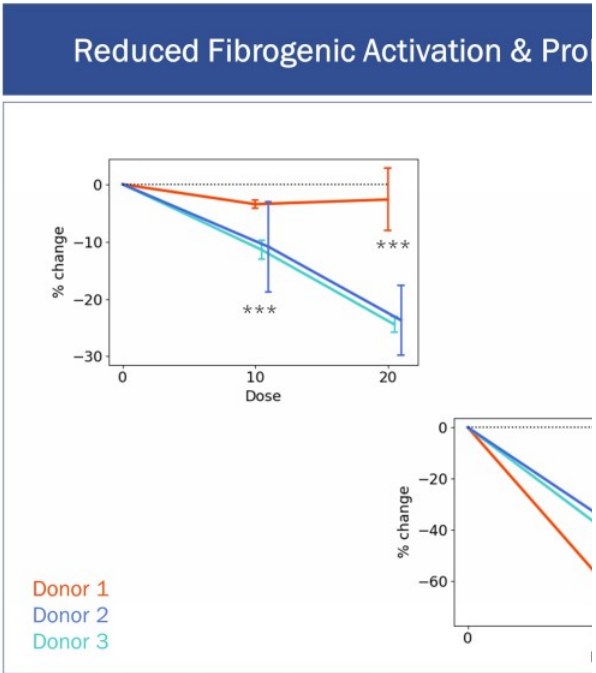

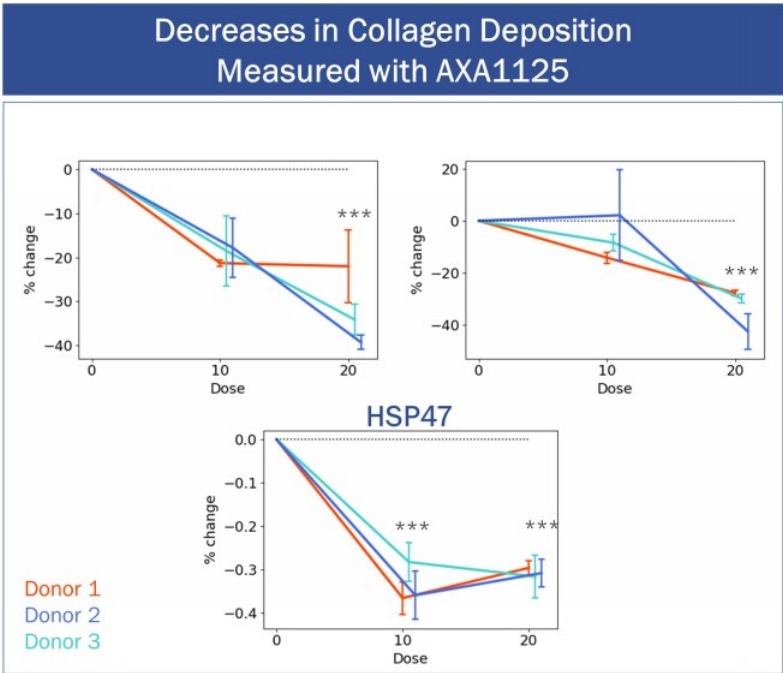

## AXA1125 Decreases Macrophage Inflammation and Cytokines

1. Daou et al. *Nat Sci Rep.* 2021. \* p < 0.05, \*\* p < 0.01, \*\*\* p < 0.001, Data from Primary Human Hepatocytes (ALT, MCP-1) treated for 48 hours with 167uM:333uM palmitate:oleate and 1 ng/ml TNF-α 1 data normalized to total protein; Data from Primary Human M1-polarized Macrophages (TNF-α, IL-6) pre-treated with LIVRQNaC for 24 hours, then stimulated with 0.15ng/mL LPS for 24 hours, data not norm

# AXA1125 Decreases Fibrosis Activation, Proliferation, and Collagen Deposition

Multi-targeted impact on fibrosis improvement: Reduced Activation, Proliferation, Deposition

1. Daou et al. Nat Sci Rep. 2021. \*\*\*p < 0.001 versus TGF- $\beta$ 1, Data from Primary Human Hepatic Stellate Cells pre-treated with LIVRQNac for 24 hours, then stimulated with 3.3ng/ml TGF- $\beta$ 1 for 24 hours, HSP47 expression normalized to GAPDH, other data not nuclei normalized.

# Key MOA Takeaways

- NASH is a complex disease with metabolic, inflammatory and fibrotic dysregulation
- Combination therapy increases potential to impact multiple targets implicated in NASH
- AXA1125 is designed as a multi-targeted agent against key NASH dysregulation targets
- Pre-clinical data demonstrates impact of AXA1125 effect on multiple cell types implicated in NASH fibrosis, inflammation and metabolic dysregulation
- Clinical data demonstrate the translation of AXA1125 MOA findings in patients

---

## SUMMARY

The current study is enrolling patients with significant NASH and fibrosis

AXA1125 appears safe and well tolerated

Oral formulation is key benefit

Non-invasive tests obtained at a relatively short time period in a subset of patients enrolled suggest a potential impact on disease activity and potentially fibrosis

Potential for use as a monotherapy or as part of a combination therapy

# Conclusion

- NASH is a large complex disease with a high need and **will require multiple strategies** to address
- AXA1125 demonstrated **best in field fibrotic activity** at 24 weeks
- AXA1125 continues to **demonstrate its differentiated targeted effects** across metabolism, inflammation, and fibrosis with both doses and in both populations
- Potential for **differentiation** in key populations
  - T2D, Adolescents, Combinations
- Well **positioned for 1<sup>st</sup> line** with attractive profile
  - Multi-targeted activity, favorable tolerability and dosing

>40M patients and growing<sup>1</sup>

Approximately 10% of U.S. children are estimated to have NASH<sup>1</sup>
